Title: Congenital Lymphedema and Angiodysplasias

Description: Congenital lymphedema is a type of lymphatic malformation and is one of many conditions in the field of vascular anomalies (angiodysplasias). The presentation will cover the subject of vascular anomalies with emphasis on congenital lymphedema. Approximately one-half of the instructional session will focus on the classification, diagnosis, and management of primary lymphedema. The remaining lecture will present the rest of the field of vascular anomalies, including capillary, lymphatic, venous, and arteriovenous malformations. Syndromic conditions with lymphatic anomalies also will be outlined.

Objectives:

1. Understand the diagnosis and management of patients with congenital lymphedema.
2. To differentiate lymphedema from other causes of extremity overgrowth.
3. Understand the classification, diagnosis, and management of the different types of vascular anomalies.
